

The OKENA StormSystem Difference

Assaults on your system have several stages. OKENA recognizes that only a layered approach is effective against security breaches that can occur at any stage, from beyond the perimeter, on the server, or at the file level. OKENA StormSystem™ proactively defends against damage to a host, and prevents industry leading Intrusion Prevention for Desktops and Servers through all phases of an attack.

Preventive security requires unique architectures that correlate activities between powerful rules engines and kernel level operations.

*Upon these architectures are built **SYSTEMS** of highly integrated products acting in unison, protecting applications from new and evolving threats, while dramatically simplifying security deployment and management.*

STORMSYSTEM

OKENA StormSystem: A true system of integrated security products that prevent attacks while reducing the burden of signature-based security.

StormSystem provides UNIQUE intrusion prevention that disrupts the viral lifecycle of an attack through all its phases
